ENERGY

A system to realize structure-property relationships

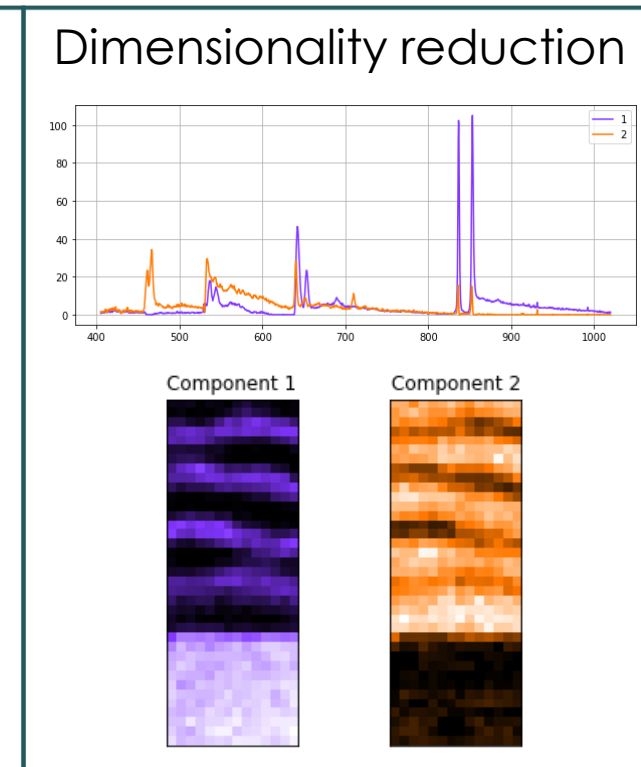

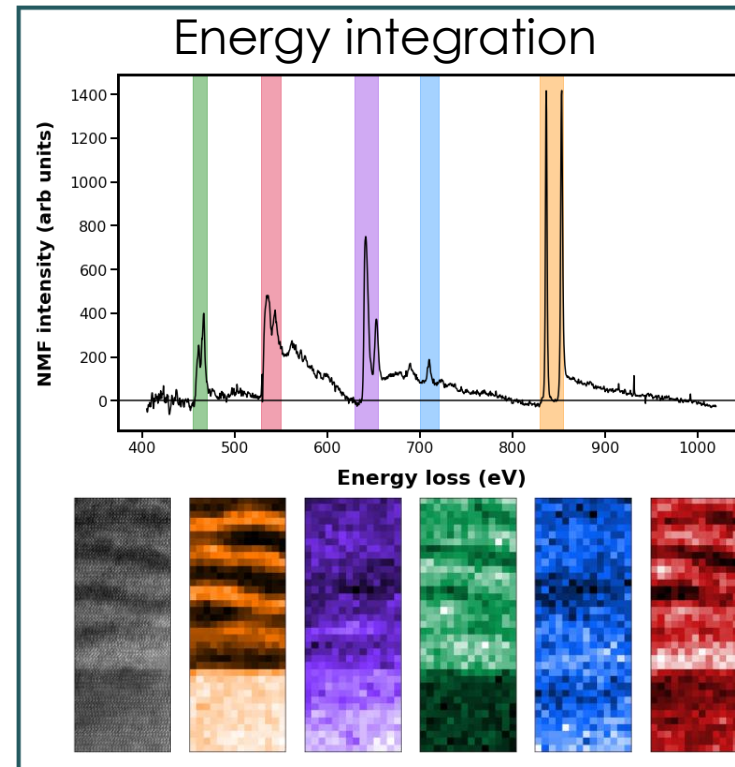

Complex nanoparticle assemblies

- Self-assembled monolayer of **metal oxide nanoparticles** (F,Sn co-doped indium oxide)
- **Sn** tunes the plasmon resonance by supply of additional e^- (F concentration fixed)
- Variety of geometric configurations also present

Electron energy loss spectroscopy (EELS)

- Can consider to be another signal in the form of a **1D spectrum**
- Collect EEL spectrum in an (x,y) grid: EELS imaging
- To better visualize / understand these 3D signals, can integrate specific spectral bands, or dimensionally reduce (PCA, NMF) them
- Applications in plasmonics & nanophotonics

Plasmonic response in complex geometries

Plasmonic response in complex geometries

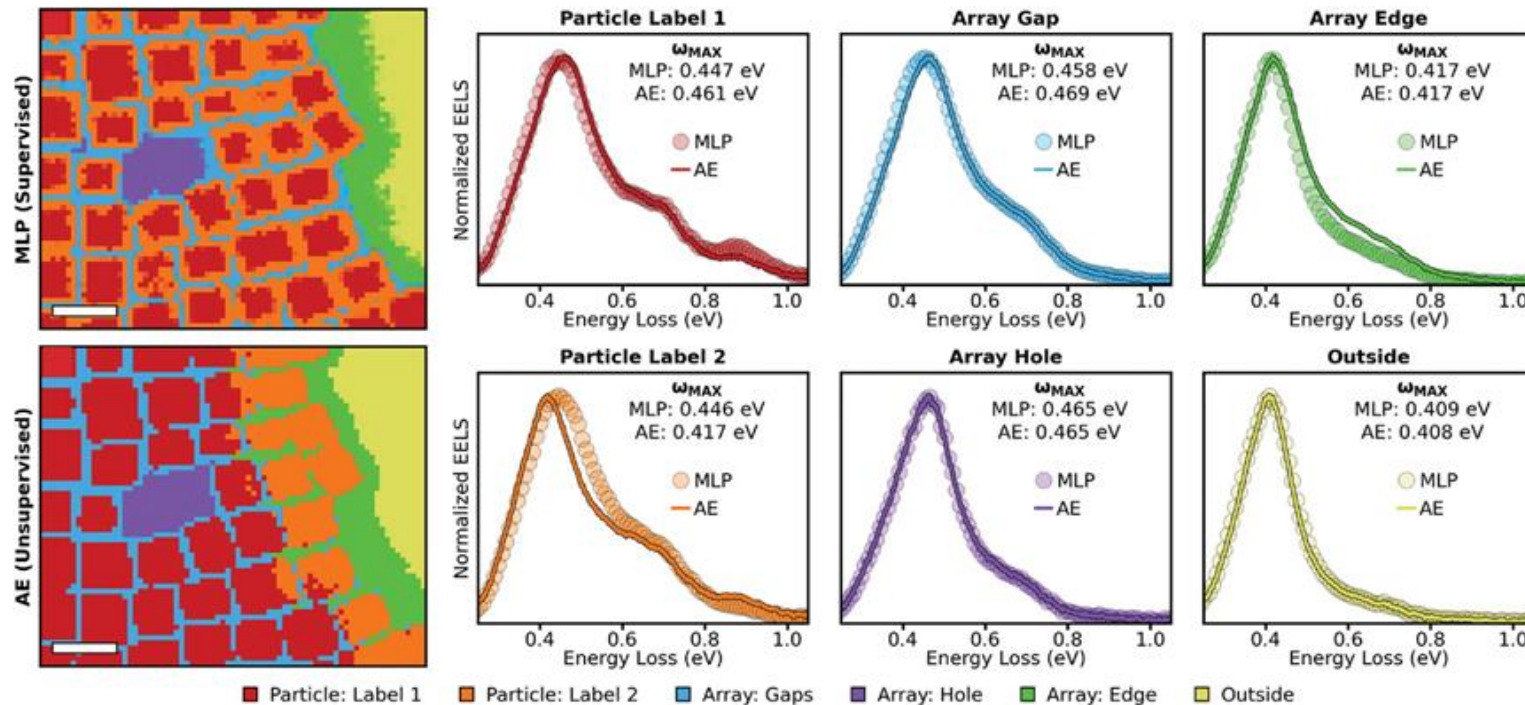

NMF

- Great way to explore system
- Visualization of hyperspectral data
- Multiple modes per pixel
- Non-physical extraction
- No relationship between geometry established

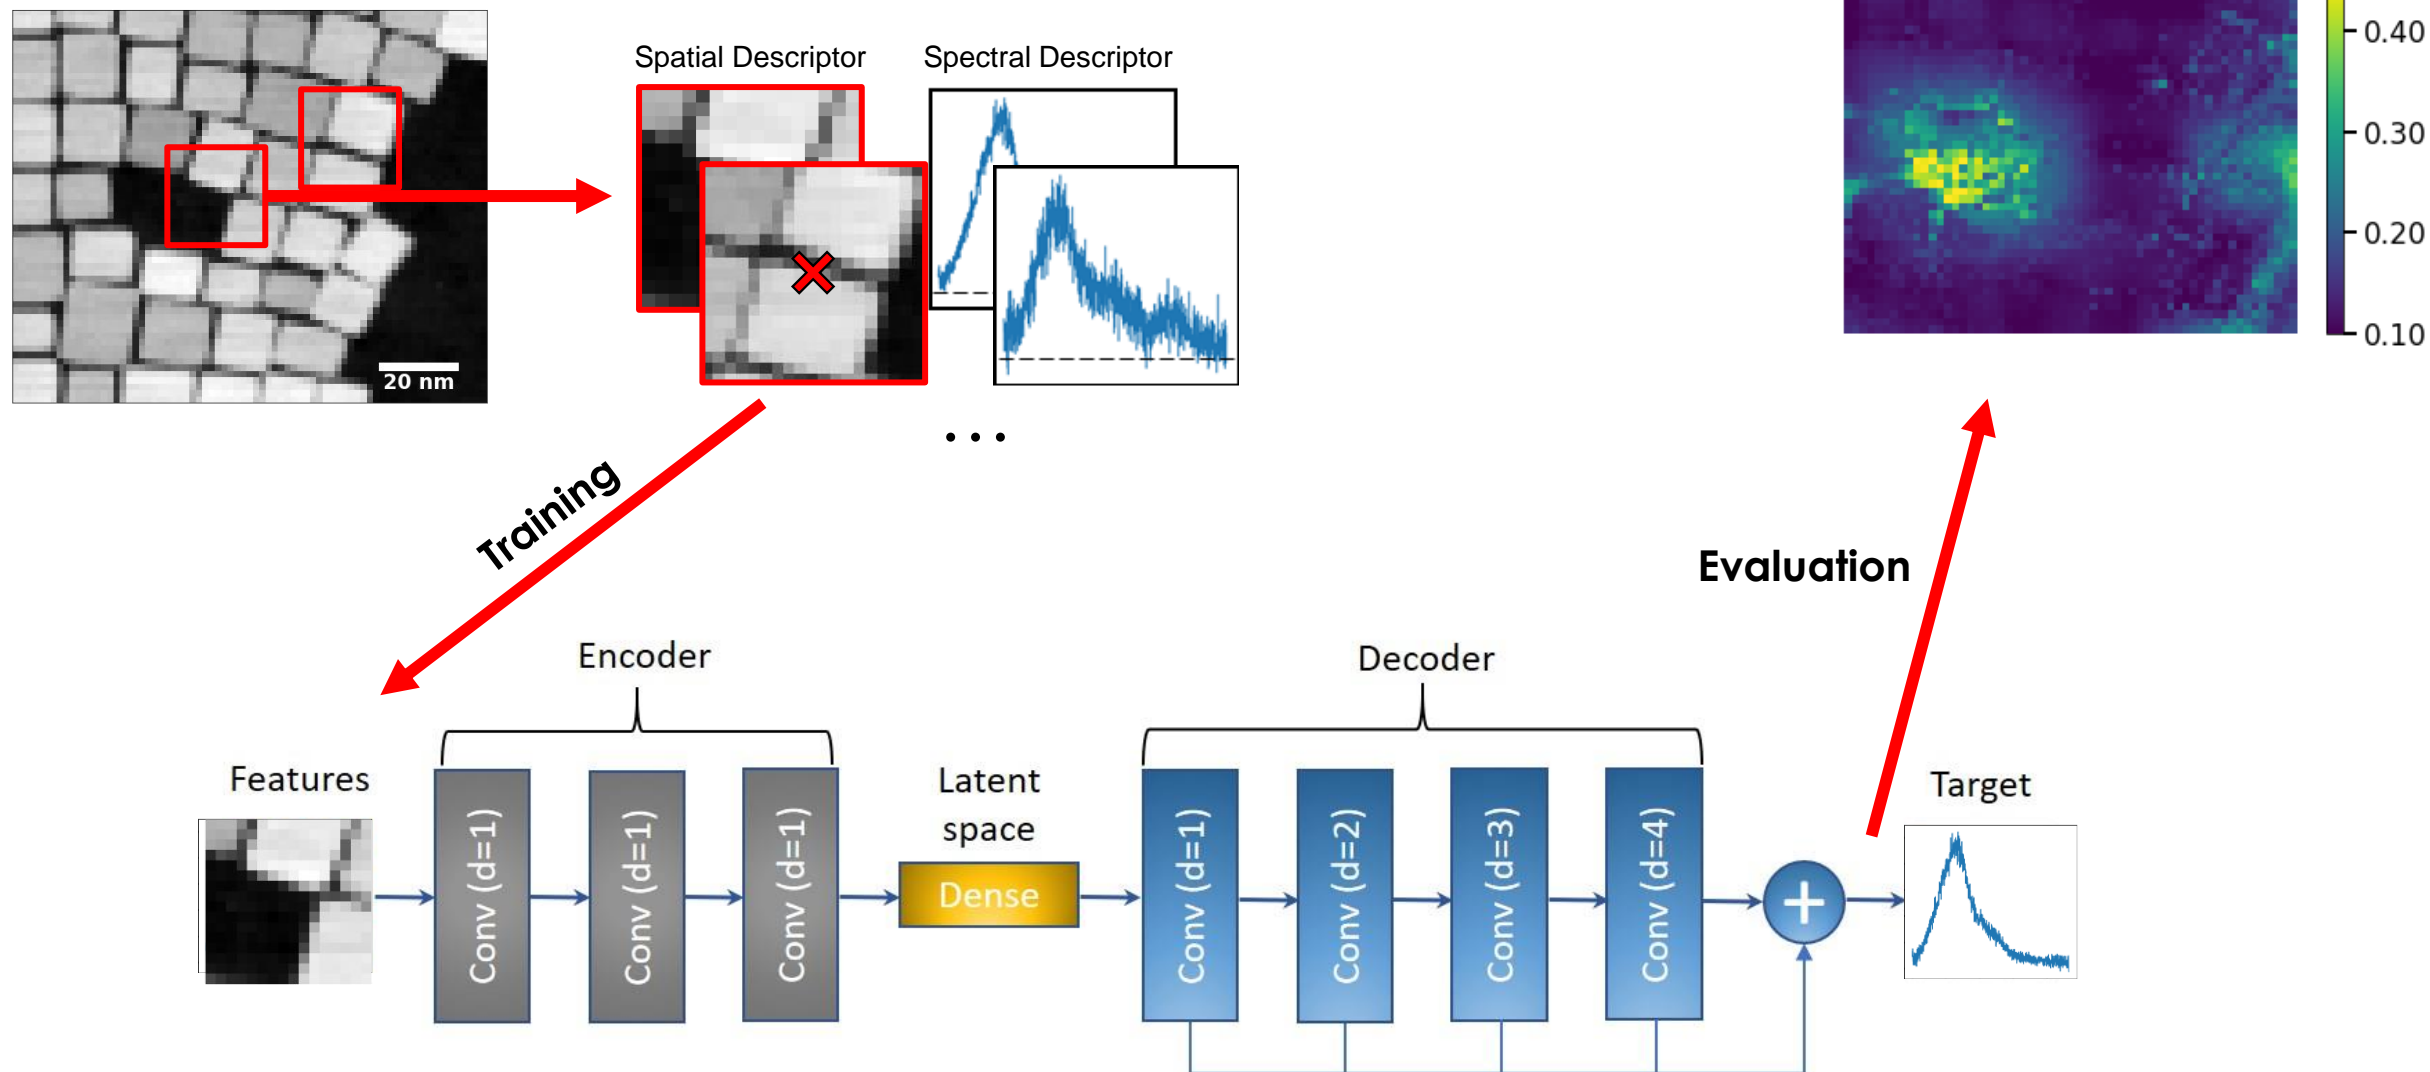

Separating effects: pixel labeling

Nonlinear ML methods: Multilayer Perceptron, Autoencoder network

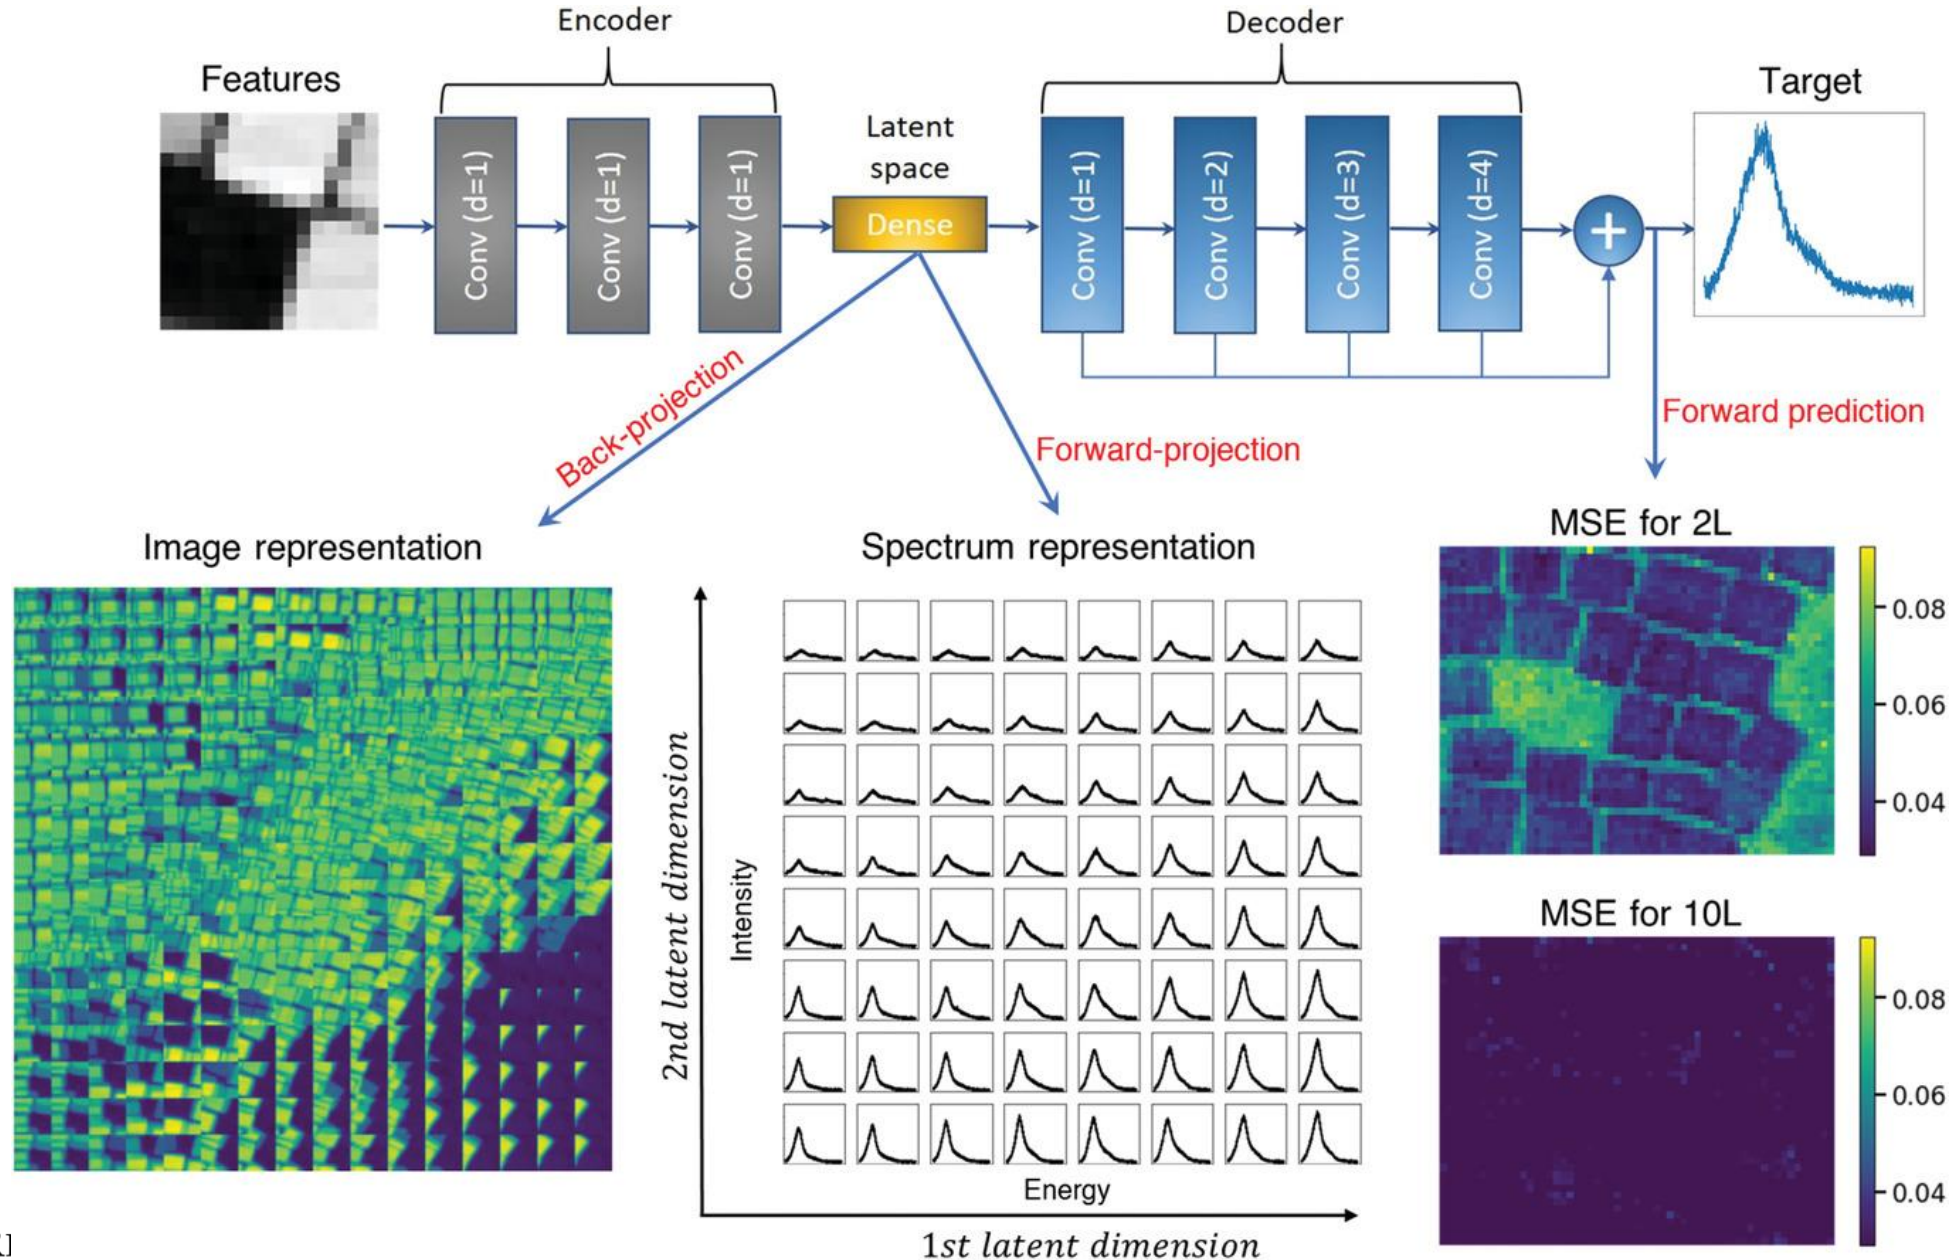

- Can separate effects
- Knows no physics
- **No relationship between geometry established**

Structure-property correlations: Autoencoder neural network

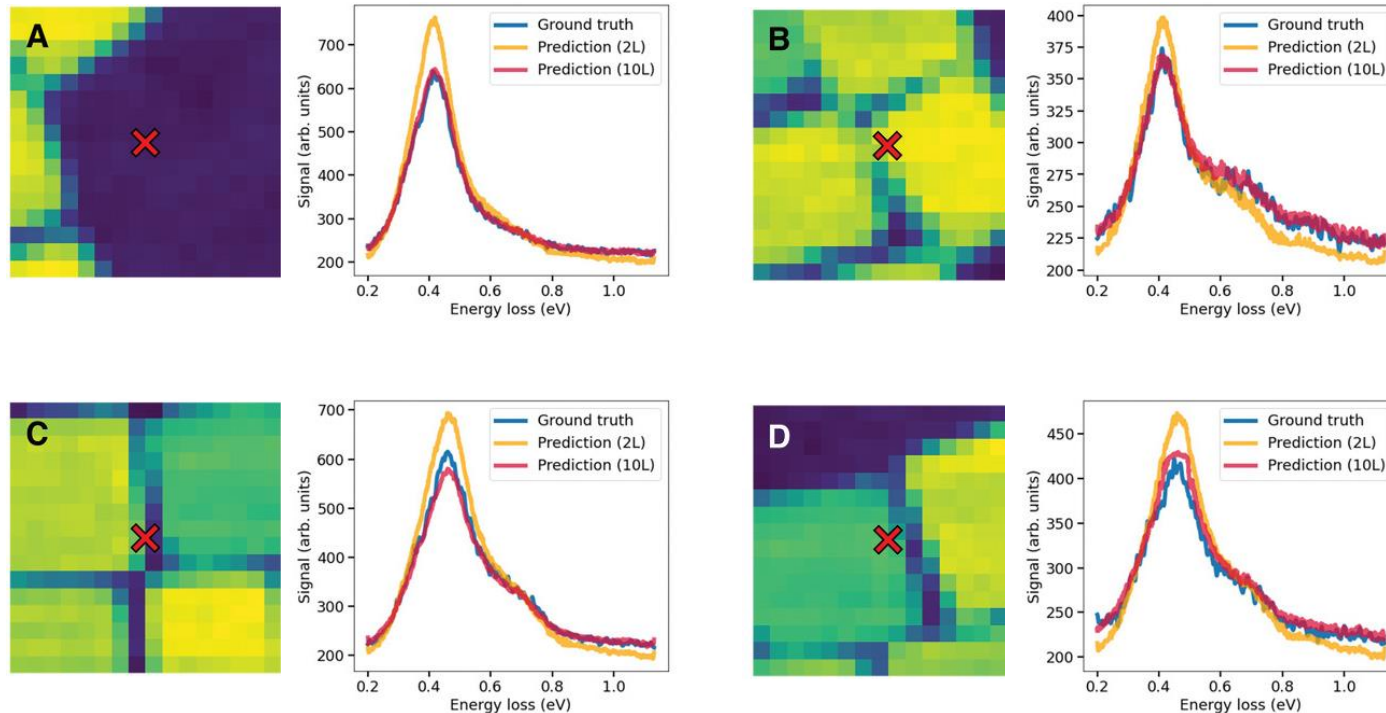

im2spec: Latent space visualization and error mapping

Encoder-decoder neural networks: Predictions

"*im2spec*"

- After training, predict the spectral response of a geometric arrangement that the network has **never encountered**
- **2L** and **10L** refers to number of latent dimensions chosen
- # spectral channels
 - can we describe spectra by simpler means?
 - (for future thoughts...)

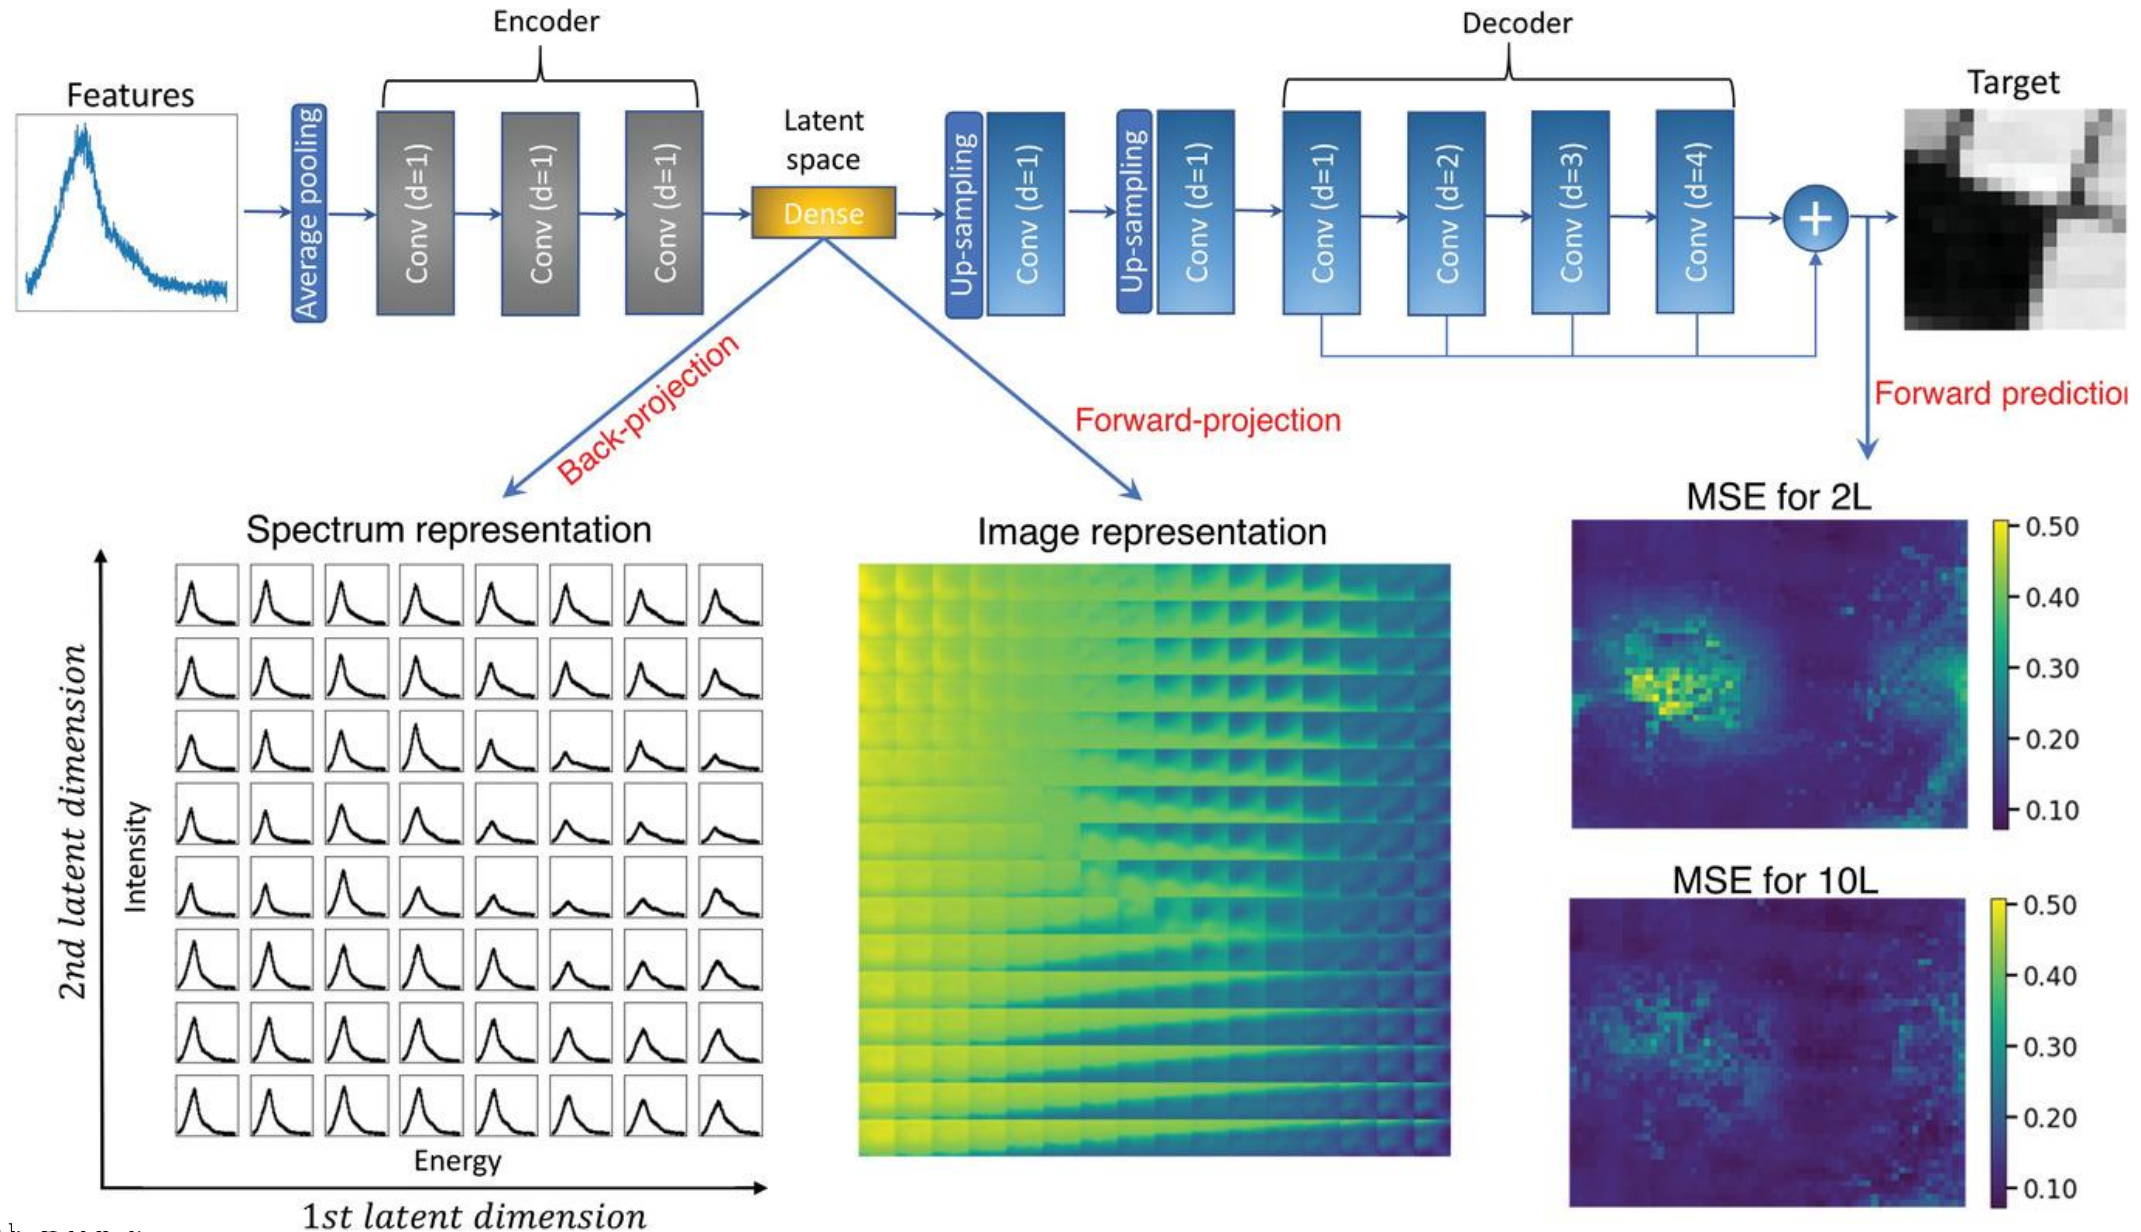

Limitations

- **Library** of geometric-plasmonic relationships
- Towards solution of inverse design in nanophotonics and other fields
- System-dependent (currently fails to generalize)
- Requires pre-acquired training data
- Working with *as-fabricated* systems

Structure-property correlations: Autoencoder neural network

spec2im: Latent space visualization and error mapping

Encoder-decoder neural networks: Predictions

"*spec2im*"

- After training, predict the spectral response of a geometric arrangement that the network has **never encountered**
- **2L** and **10L** refers to number of latent dimensions chosen
- # spectral channels
 - can we describe spectra by simpler means?
 - (for future thoughts...)

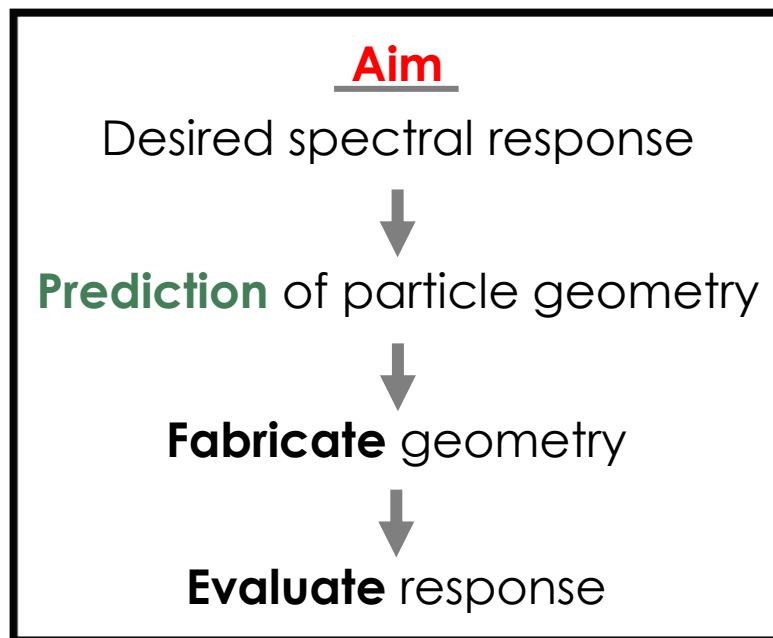

Limitations

- System-dependent (currently fails to generalize)
- Requires pre-acquired training data
- Working with *as-fabricated* systems

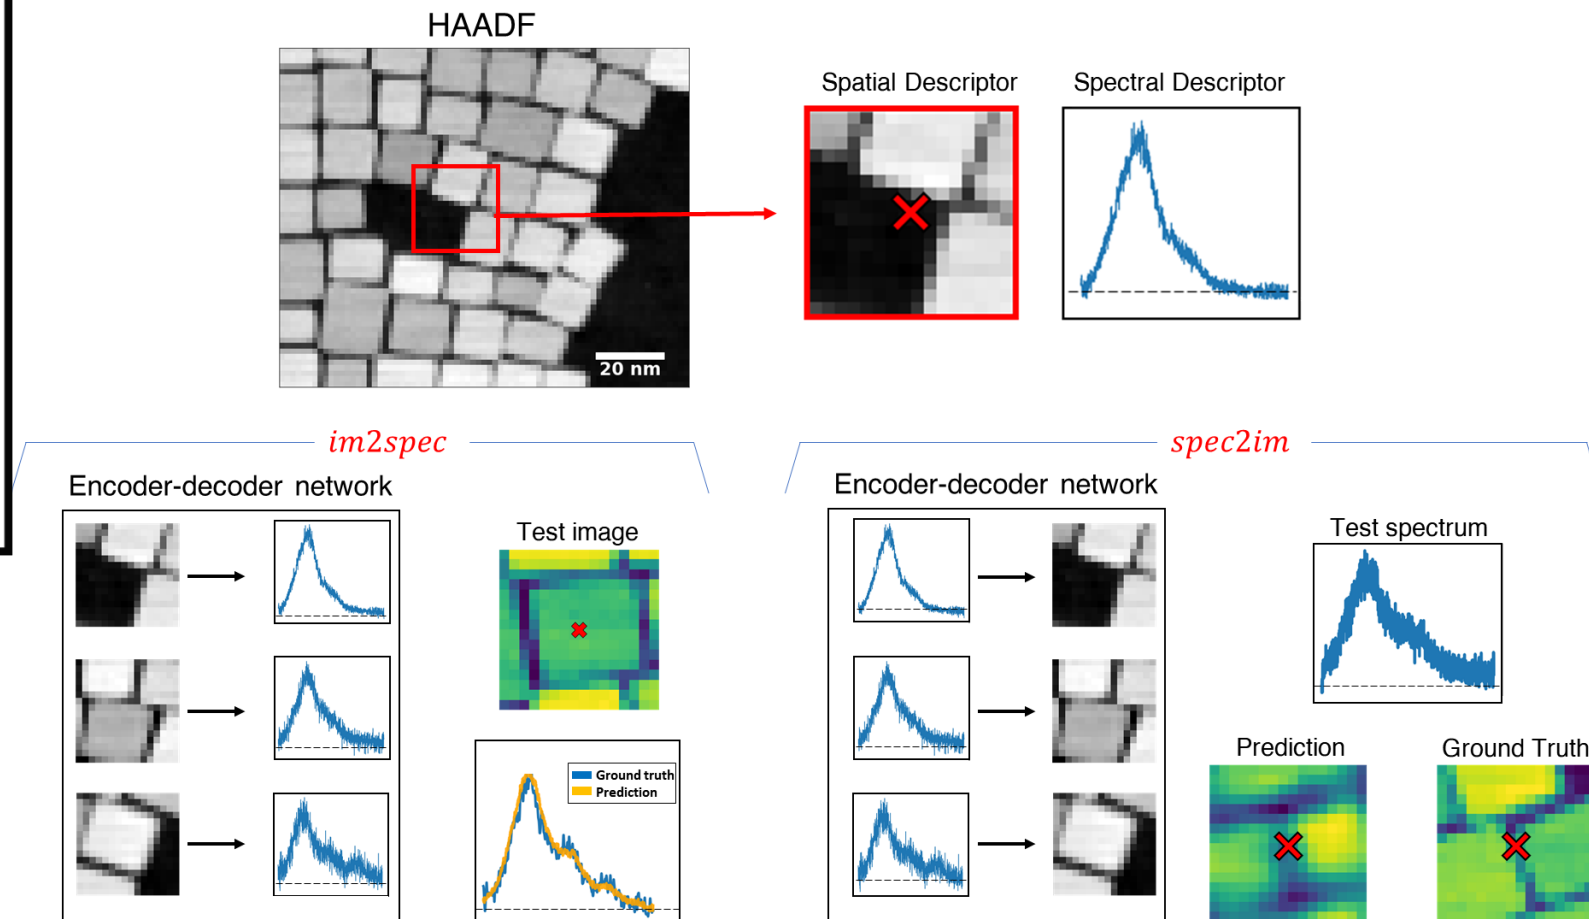

In summary:

Correlative structure property relationships

- We can **learn the relationship** between local geometry and plasmonic response

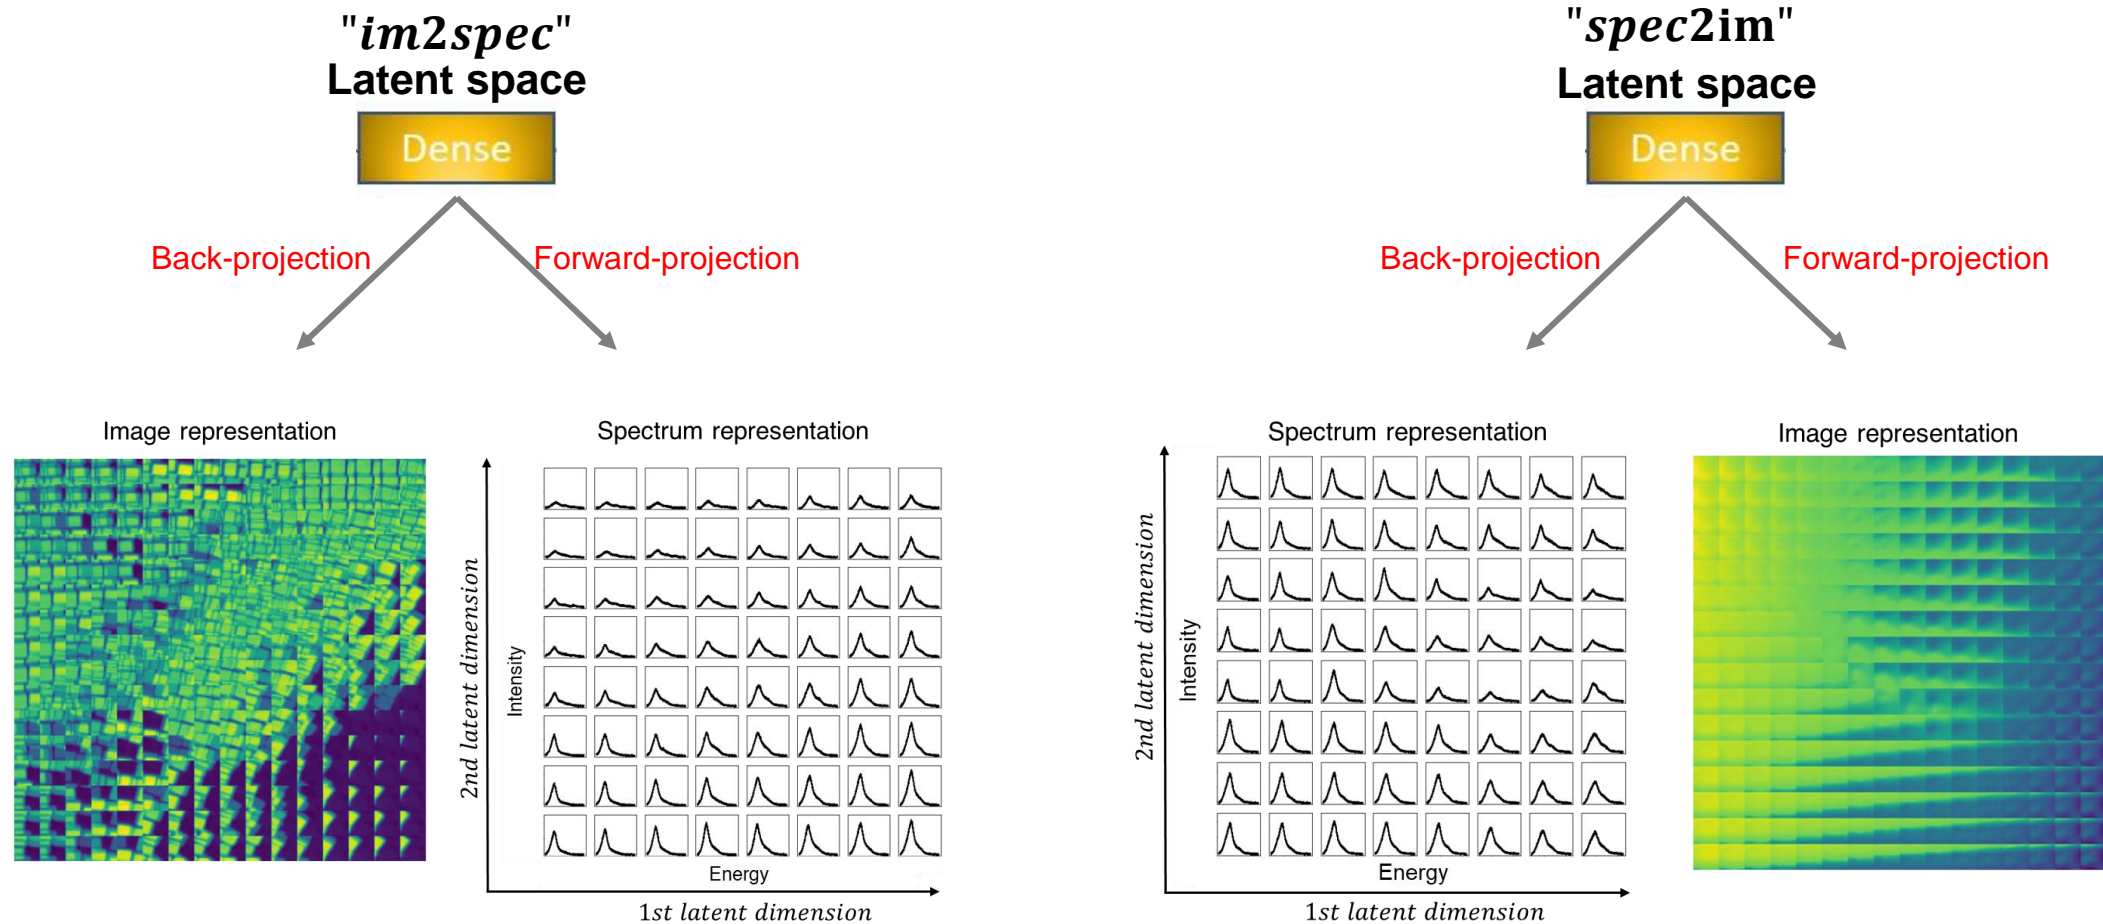

- We operate with **complete (preacquired)** 3D data
- Random particle geometries

In summary:

Correlative structure property relationships (Visualizing)

Can we engineer the ones that exhibit spectral properties we desire? under certain conditions, **yes!**

- High current density ($\sim 10^6$ A/cm²)
- 60 – 200 kV beam energies
- Monitor plasmonic responses dynamically (EELS)

- Build a library of structure-property relationships to guide inverse design?

Going forward

- Increased geometric variation, fields of view...
- Moving beyond the *as-fabricated* particle restrictions:
Designing and testing other geometries
- “inverse problem”
- Automated experiments **(on the fly)!**
 - *deep kernel learning*
- **Colab!**

Encoder-decoder neural networks: Geometric Predictions

"spec2im"

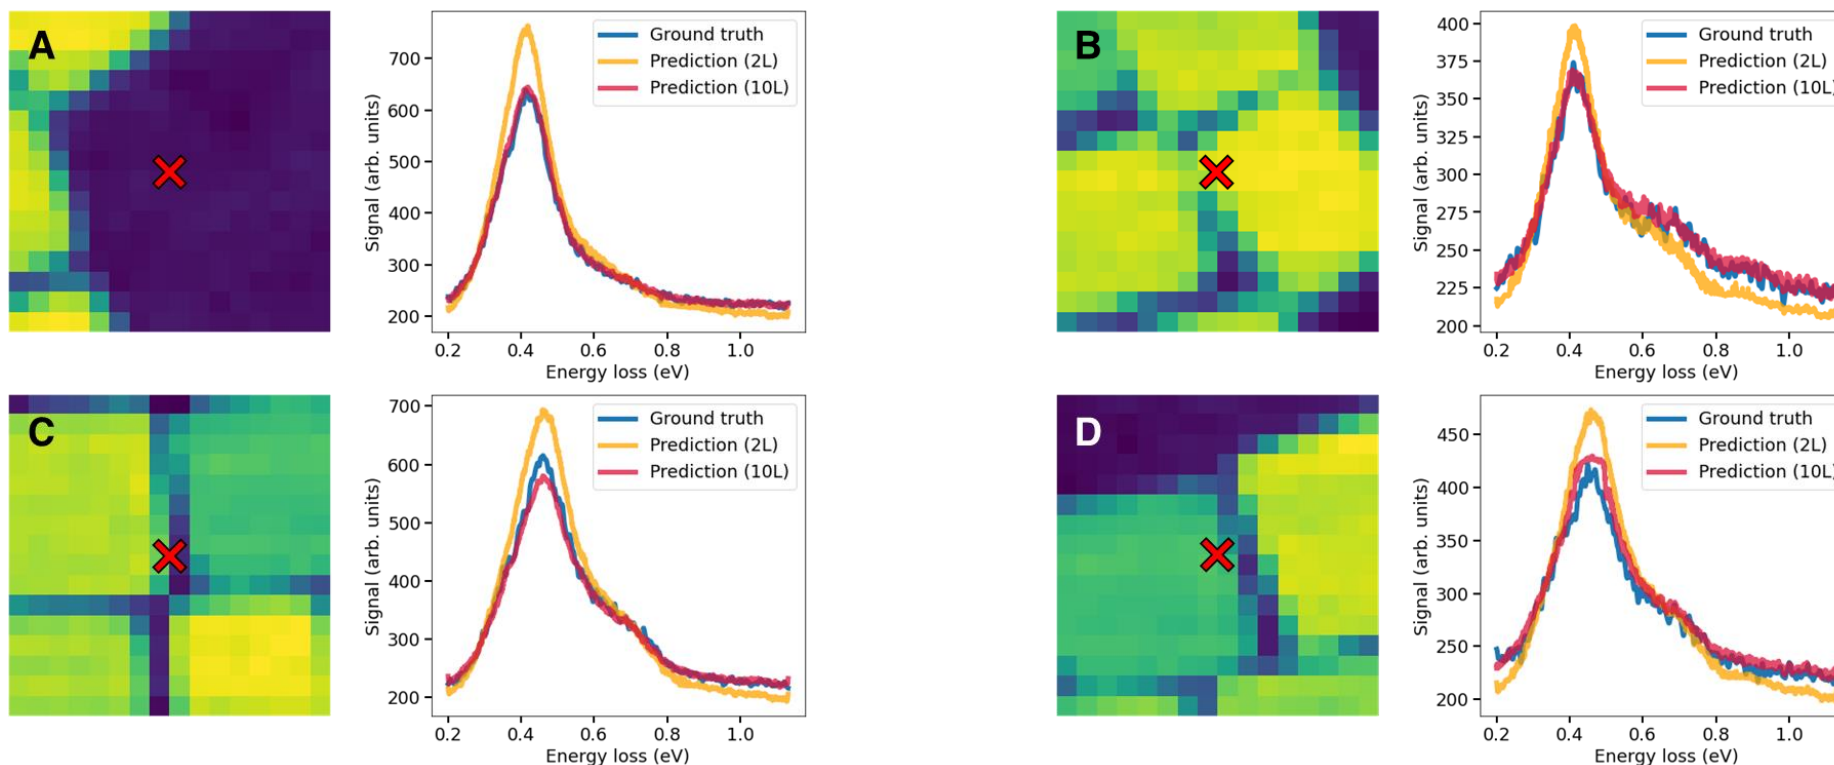

- Predict the geometric arrangement given a spectrum that the network has **never encountered**
- **2L** and **10L** refers to number of latent dimensions chosen

Encoder-decoder neural networks: Spectral Predictions

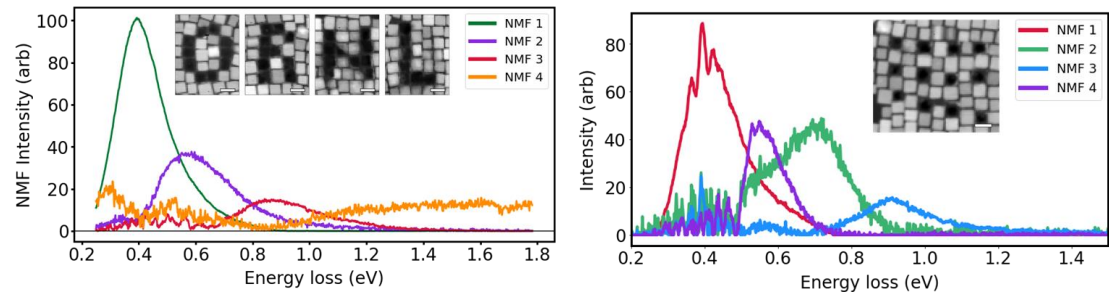

"im2spec"

- After training, predict the spectral response of a geometric arrangement that the network has **never encountered**
- 2L** and **10L** refers to number of latent dimensions chosen

Electron beam modification of plasmon response

Space

Scalebars 20 nm

Energy

Scalebars 20 nm

Material system: doped indium oxide

- Self assembled monolayer
- co-doped with F and Sn
- **Sn** tunes (*during synthesis*) the plasmon resonance by supply of additional e^-
- Supported on silicon nitride membrane

Structure-property correlations: Autoencoder neural network
